

Grader Shaker

The Jr.-Grader Shaker is specially designed as a part of the cut, wash, grade and dry line. The Jr. Grader Shaker is designed to remove slivers and undersized pieces of product from the main flow. As the product passes over the Grader Shaker the undersized product is separated from the good product. The undersized product is dropped to the lower deck and moved to a discharge point. The good product passes across the main deck and then is discharged into the Wash & Chill System. From there, the product discharges into the Jr.-Dryers' 20 gallon container for further water extraction. The clean operation design allows easy cleanability.

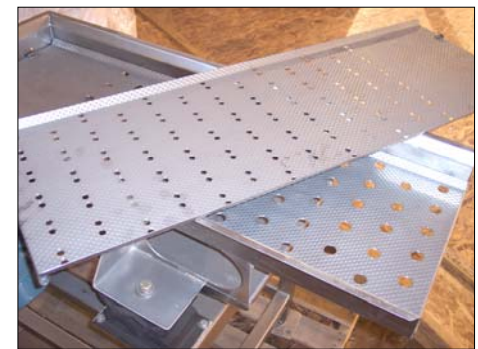

Adjustable Force

The Jr. Grader Shaker comes with two fully adjustable force output vibrators to control the speed of the product passing across the grading screen. For high pounds per hour, turn the force up, for low pounds per hour, turn the force down.

Solidly built to perform for the long run

- Stainless Steel construction to withstand the toughest environments
- Adjustable force vibrators
- 6" adjustable legs for easy leveling of system
- Special lattice isolation mounts

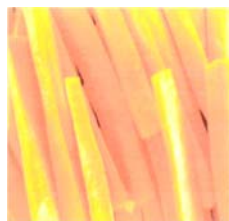

Different Size Removable Screens Available
